

Overview:

My app for project 3 will be a to-do app. The app will be able to create different tasks that are saved. The data will be persistent. I will use the task bar to implement an add button for the tasks and done buttons that appear in a table next to each item. I'm creating this app because I want to solidify my understanding of android, since I am still not confident with building apps for the platform. Some stretch goals for the project are alerts and tagging into different projects.

User flow:

The user will tap an add button in the upper right on the task bar that brings up a screen to input a to-do item, add a due date, and put it into a project category. After hitting done the item will be added to a to-do list and the user will go back to the initial screen where the newly added activity will be shown along with any other previous items. The items will be presented in a listview. On the right side of each list item will be a done button that will complete the item and remove it from the list.
